# --- End of Program ---
```

OUTPUT

```
Original DataFrame:
      Name  Age  Salary Department
0    Alice   25   50000         HR
1      Bob   30   60000         IT
2  Charlie   35   70000    Finance
3    David   40   80000  Marketing
4      Eva   45   90000      Sales
--------------------------------------------------
Sliced DataFrame using iloc (index-based slicing):
      Name  Age  Salary Department
1      Bob   30   60000         IT
2  Charlie   35   70000    Finance
3    David   40   80000  Marketing
--------------------------------------------------
Sliced DataFrame using loc (label-based slicing):
      Name  Age  Salary Department
1      Bob   30   60000         IT
2  Charlie   35   70000    Finance
3    David   40   80000  Marketing
--------------------------------------------------
Accessing 'Age' column:
0    25
1    30
2    35
3    40
4    45
Name: Age, dtype: int64
--------------------------------------------------
Accessing multiple columns 'Name' and 'Salary':
      Name  Salary
0    Alice   50000
1      Bob   60000
2  Charlie   70000
```

3 David 80000 4 Eva 90000 -- ------ Filtering DataFrame where Age > 30:
Name Age Salary Department 2 Charlie 35 70000 Finance
3 David 40 80000 Marketing 4 Eva 45 90000 Sales --------

DataFrame with new 'Salary_in_K' column:

	Name	Age	Salary	Department	Salary_in_K
0	Alice	25	50000	HR	50.0
1	Bob	30	60000	IT	60.0
2	Charlie	35	70000	Finance	70.0
3	David	40	80000	Marketing	80.0
4	Eva	45	90000	Sales	90.0

----------- Number of dimensions of DataFrame: 2 -------------------------
----------------------- Original NumPy array: [[1 2 3] [4 5 6] [7 8 9]] -------
-- Reshaped NumPy array (1D):
[1 2 3 4 5 6 7 8 9] ---
Raveled NumPy array: [1 2 3 4 5 6 7 8 9] ---------------------------------------
----------- Number of dimensions of NumPy array: 2 -----------------------
------------------------- Array slicing -
Select rows 1 and 2, columns 0 and 1: [[4 5] [7 8]] -------------------------
----------------------- Transposed NumPy array: [[1 4 7] [2 5 8] [3 6 9]] ---
--- Element-wise addition (arr + 10):
[[11 12 13] [14 15 16] [17 18 19]] --
Element-wise multiplication (arr * 2): [[2 4 6] [8 10 12] [14 16 18]] -----
----
Converted 'Salary' column from DataFrame to NumPy array:
[50000 60000 70000 80000 90000] --
------- DataFrame with updated salaries (10% increase):

	Name	Age	Salary	Department	Salary_in_K	Updated_Salary
0	Alice	25	50000	HR	50.0	55000.0
1	Bob	30	60000	IT	60.0	66000.0
2	Charlie	35	70000	Finance	70.0	77000.0
3	David	40	80000	Marketing	80.0	88000.0
4	Eva	45	90000	Sales	90.0	99000.0

NumPy array from 'Salary' and 'Department' columns of DataFrame:
[[50000 'HR'] [60000 'IT'] [70000 'Finance'] [80000 'Marketing']
[90000 'Sales']] --

In [3]:

```python
import pandas as pd

# Create a DataFrame
data = {
    'Name': ['Alice', 'Bob', 'Charlie', 'David'],
